

Four of these problems will be graded, with each problem worth 5 points. Clear and complete justification is required for full credit. You are welcome to discuss these problems with anyone and everyone, but must write up your own final submission without reference to any sources other than the textbook and instructor.

1. Do Exercise 5.1.2(e).
2. Do Exercise 5.1.3(a).
3. Do Exercise 5.1.6.
4. Do Exercise 5.1.9(a).
5. Prove Corollary 5.2.2(a).
6. Give an example of a function  $f$  that is differentiable at  $x = a$  such that  $f'(a)$  exists, with  $f'(a) \neq 0$ , but yet  $f$  attains a relative extremum at  $x = a$ .
7. Give an example of a function  $f$  that is continuous at  $x = a$ , not differentiable at  $x = a$ , but yet  $f$  attains a relative extremum at  $x = a$ .
