## **Examlet 2** Advanced Geometry 3/1/17

1.	a)	State the definition of a scalene triangle.
	b)	State the definition of a <i>quadrilateral</i> .
	c)	State the Saccheri-Legendre Theorem.
	d)	State the Scalene Inequality.
	e)	State the Universal Hyperbolic Theorem.

2.	Which of the following are equivalent (given the other postulates of neutral geometry) to the Euclidean Parallel Postulate? Check all that apply.		
	☐ The double perpendicular construction		
	☐ The Saccheri-Legendre Theorem		
	☐ Existence of rectangles		
	☐ Euclid's Postulate V		
	☐ Converse of the Alternate Interior Angles Theorem		
	$\Box$ If $\triangle ABC$ is a triangle, then $\sigma(\triangle ABC) = 180^{\circ}$ .		
	☐ Clairaut's Axiom		
	☐ A unicorn ate my petunias.		
	$\Box$ There exists a triangle whose defect is 0°.		
	☐ The Universal Hyperbolic Theorem		

3. Provide good justifications in the blanks below for the corresponding statements:

Proposition: If  $\ell$  and  $\ell'$  are two lines cut by a transversal t in such a way that a pair of alternate interior angles is congruent, then  $\ell$  is parallel to  $\ell'$ .

Statement:	Reason:
Let $\ell$ and $\ell'$ be two lines cut by transversal $t$ such that a pair of alternate interior angles is congruent.	
Choose points $A$ , $B$ , $C$ , and $A'$ , $B'$ , $C'$ as in the figure above. Suppose $\angle A'B'B \cong \angle B'BC$ .	
We must prove that $\ell$ is parallel to $\ell'$ . Suppose there exists a point $D$ such that $D$ lies on both $\ell$ and $\ell'$ .	
If D lies on the same side of t as C, then $\angle A'B'B$ is an exterior angle for $\triangle BB'D$ ,	
while $\angle B'BC$ is a remote interior angle for $\triangle BB'D$ .	
This is a contradiction.	
In case $D$ lies on the same side of $t$ as $A$ , then $\angle B'BC$ is an exterior angle and $\angle A'B'B$ is a remote interior angle for $\triangle BB'D$ ,	
and again we have a contradiction.	
Since $D$ must lie on one of the two sides of $t$ ,	
we are forced to conclude that the proposition holds.	

4. Provide good justifications in the blanks below for the corresponding statements:

Proposition: If there exists one line  $\ell_0$ , an external point  $P_0$ , and at least two lines that pass through  $P_0$  and are parallel to  $\ell_0$ , then for every line  $\ell$  and for every external point P there exist at least two lines that pass through P and are parallel to  $\ell$ .

Statement:	Reason:
S'pose there exists a line $\ell_0$ , an external point $P_0$ , and at least two lines that pass through $P_0$ and are parallel to $\ell_0$ .	Hypothesis
Then the Euclidean Parallel Postulate fails.	
No rectangle exists.	
Let $\ell$ be a line and $P$ an external point.	
We must prove that there are at least two lines through $P$ that are both parallel to $\ell$ . Drop a perpendicular to $\ell$ through $P$ and call the foot of that perpendicular $Q$ .	
Let $m$ be the line through $P$ that is perpendicular to $\overrightarrow{PQ}$ .	
Choose a point $R$ on $\ell$ that is different from $Q$ and let $t$ be the line through $R$ that is perpendicular to $\ell$ .	
Drop a perpendicular from <i>P</i> to <i>t</i> and call the foot of the perpendicular <i>S</i> .	
Now $\square PQRS$ is a Lambert quadrilateral.	
But $\Box PQRS$ is not a rectangle (reason?), so $\angle QPS$ is not a right angle and $\overrightarrow{PS} \neq m$ .	
Nevertheless $\overrightarrow{PS}$ is parallel to $\ell$ ,	
so our proof is complete.	Because our proof is complete.

5.	a)	Prove or give a counterexample: If one interior angle of a triangle is obtuse, then both the other interior angles are acute.
	b)	Prove or give a counterexample: If one interior angle of a triangle is acute, then at least
	b)	Prove or give a counterexample: If one interior angle of a triangle is acute, then at least one of the other interior angles is obtuse.
	b)	Prove or give a counterexample: If one interior angle of a triangle is acute, then at least one of the other interior angles is obtuse.
	b)	Prove or give a counterexample: If one interior angle of a triangle is acute, then at least one of the other interior angles is obtuse.
	b)	Prove or give a counterexample: If one interior angle of a triangle is acute, then at least one of the other interior angles is obtuse.
